

# Constructed wetlands for soil remediation and groundwater management

GQ, Liege, September 2019

Nanne Hoekstra (Deltares), Paul Verhaagen (HMVT)

### <u>Content</u>

- 1. Constructed wetlands
  - What is a constructed wetland?
  - Building blocks: transport, treatment, biodegradation, energy.
- 2. Cases
  - Amersfoort ; railway station
  - Doorn ; large contamination plume from a drycleaner
  - Zwolle ; interception of multiple plumes from downtown to protect the public drinking water source

### **Constructed wetlands**

A constructed wetland (CW) is an artificial swamp in which polluted (ground-)water is purified

### Advantages:

- optimal use of biological processes
- fully integrated in the landscape
- low operational costs
- energy-neutral

### Building blocks for a constructed wetland

- Transport of contaminated water
- Design tailored to the specific contaminants
- Biodegradation of contaminants
- Energy supply (preferably green)

hmv

Deltares

### 3 cases: constructed wetlands in operation

1. Amersfoort: railway station

- 2. Doorn: large contamination plume from a drycleaner
- 3. Zwolle: interception of multiple plumes to protect public drinking water source

### Amersfoort Railway Site (case 1)

### **Sampling locations**

### **Construction wetland**

Finished wetland with gravel on top

Building wetland with scoria & straw

Helofytes planted 10 pcs/m<sup>2</sup>

### Field test

hmv

### **Biochemical conditions**

- Over the flow path:
  - Redox conditions optimize
  - Both organisms capable of reductive dechlorination and VCoxidation develop
- Conditions in winter less suitable

Deltares

### Relative degradation for PCE, in winter and summer

### **Conclusions Amersfoort Railway site**

- Full PCE dechlorination in wind powered constructed wetland achieved
- Constructed wetland is self-sustaining
- Tailoring the design to local weather and subsurface conditions is important (*micro organisms; DOC, nitrate/sulphate, wind, temperature, contaminant concentrations, etc.*)
- Seasonal variation in wind and temperature affect the system, but treatment efficiency remains sufficient
- Constructed wetlands are economically attractive: lower investment costs, significant lower operational costs.

Deltares

### House Doorn : interception plume (Case 2)

National Monument -Refuge where the German emperor Wilhelm II spent his last years after the First World War (1918-1941)

# Plume originating from dry-cleaner is intercepted by feeding well for castle moat

Groundwater contaminated with 2500 µg/I PCE

### **Conclusions / Lessons Learned**

- Constructed wetlands are a robust solution to treat moderate concentrations of pollutants.
- Very low operational costs. Focus points:
  - when changing from anaerobic to aerobic: risk of iron precipitation
  - excessive plant growth: mow periodically
  - regular site maintenance: tree pruning, etc.
- Constructed wetlands provide a combination of functions. In addition to groundwater restoration:
  - local supply of heat / cold for buildings
  - public parks, more attractive urban environment
  - bringing natural cooling into an urban environment
- By combining functions you can have multiple sources of financing

### **Opportunities for CW in urban areas**
